Hello,  
Here is my test environment.

I am trying to push Acrobat Reader with group policy.  
Got 1 Windows 2003 SBS and 1 client computer.

SBS box has active directory installed. GPMC installed.  
In active directory I have created an OU called "Desktops" and moved the client computer to this OU.  
For creating a GPO, I right click on the OU, Right Click it> Go to Properties > Group Policy >  
There I create a GPO called Acrobat. Under Group Policy Object Editor > Computer Configuration > Software Settings> Software installation I create a package.

Name	Version	Deployment	State
Source			
Acrobat Reader	8.1.0	8.1	Assigned
\\testserver\Acrobat\Acrobat.msi			

The above are the settings of the package.

On the client computer I do a gpupdate /force  
Restart the client.

The client still doesnt installs the software?  
Could anyone please point where I am going wrong?

I am learning Windows server.  
Your help will be really appreciated.
