It could be stuck emails. Do you get 1023 and 1036 for all email addresses or just for specific ones?

It is happening on all of the accounts and and there is nothing in their mailboxes when these errors get generated. I am thinking that the culprit(s) is/are with the firewall (which is administered by another company) and/or the ISP (which has been having issues with uptime).

Considering these seem to be time out/non-connect issues (they are, right?) would this analysis be correct? I will look into this more this afternoon when I am in contact with the company that administers the firewall to see if they are getting a similar/comparable level of red flags.
