I have a memory leak again I think and when I run poolmon the top 3 items are:

ObSt – Non paged – Object Manager temporary storage i think

Io – non paged – general IO allocations

File – non paged – File objects

IoNM – paged – Io parsing names

(provided by

<http://blog.tiensivu.com/aaron/archives/10-A-long-list-of-non-paged-pool-reference-IDs-which-is-handy-when->

I think that's what those mean but not sure why they're eating up memory which then crashes services on the server and leads back to Connections Refused in my HTTPERR.log. If you can help in anyway let me know. Last time I had this issue we found that even though the web was crashing it was because of a memory leak. Same issue again just different memory leaks. The link below shows why:

<http://blogs.msdn.com/david.wang/archive/2005/09/21/HOWTO-Diagnose-IIS6-failing-to-accept-connections-due->

Please help me out!
