> I'm running a Windows SBS 2003 domain with ms xp pro clients. I have shares on the domain located on the server machine. The domain name is tmfm and the server machine name is tmfm1. Most clients on the network can access the shares by the following path, \\tmfm1. All shares a user has permissions on are available via this path.
>
> The problem comes into play on only two of our clients. When \\tmfm1 is opened in explorer, the regular shares are not visible. Instead "Users Shared Folders" and "Users" display as the only 2 shares (16+ shares should be available). The problem can be fixed by typing in the fully qualified domain name, tmfm1.tmfm.local. Once this is done, all shares are visible on the two machines that were having issues.

Please post an unedited ipconfig /all from your server & a problem client, clearly identifying which is which.

.
