Check their usage and disk quotas (right-click the disk, properties, Quota tab, click Quota Entries near the bottom to see all usage – you can double click the user to change their personal limit)

Hello All,

Does anyone know what could possibly be the problem when a user is trying to save a document into the SBS shared drive and gets an error that "not enough free space, disk full" when there is abundant capacity on the HDD on the server?

Thanx.
