Hi Teneo,

No, nothing has been installed recently on these machines. No service packs done recently either. I couldnt see anything in the logs too. The only error message I found around the same time as an alert this morning was:

The time provider NtpClient is currently receiving valid data from server.domain.local (ntp.d\0.0.0.0:123->serverip:123).

Though this seems harmless.

I'll have to keep an eye on it as its making me uneasy :-/

Hi Mehdis..

Do the workstations have anything in their app/security/system logs corresponding to the same time as the server log..?

As they are vista, has SP1 been applied recently ? Not that I am aware of any issues though.

Has anything else been applied / configured to those pcs recently

Hi all,

Late this afternoon I received around 80 failed security login alerts from 3 computers in the office (these 3 machines are all vista). It's the first time this seems to have happened. One of the users wasn't even using their PC when

Re: Logon type 3 – ID 529

the alert appeared.

Details are:

Event ID: 529

Logon Failure:

Reason: Unknown user name or bad password

Domain: companydomain

Logon Type: 3

Logon Process: NtLmSsp

Authentication Package: NTLM

Workstation Name: VISTAMACHINE

All other fields are blank including 'User Name'

I've read logon type 3 can be caused due to access of shared folders/printers but doesnt explain why its suddenly occuring now.

Any ideas to why this occuring would be much appreciated!
