In addition, since users' My Documents folders are redirected into the Users Shared Folder by default while it applies the 1GB limit to these folders, I think it is messing with the network shared folder which also resides in the Users Shared Folder. I have compared settings with other SBS servers I manage and cannot find a difference. How do I unapply/remove the 1GB limit on the network shared folder created in the Users Shared Folder?

Thanx.

"MF" wrote:

So, now on an entirely different client's new SBS 2003 server standard install, I noticed that on users' computers, when you hover the pointer over the mapped network share it displays a size of 1GB when it is supposed to be a 500GB HDD mainly dedicated to User Shares. It seems the 1GB desktop redirection limit is being applied to the whole of the network share and as a user with 99% of used My Documents space tried to save a tiny file on the network share today it simply told her the disk is full. When I looked at her My Documents folder it was indeed full but she could not save in the shared folder as it is telling her the disk is full. This is supposed to be the network share on a 500GB HDD.

Any ideas?

Thanx.

Check their usage and disk quotas  
(right-click the disk, properties,  
Quota tab, click Quota Entries near the  
bottom to see all usage – you can  
double click the user to change their  
personal limit)

Hello All,

Does anyone know what  
could possibly be the  
problem when a user is  
trying to  
save a document into the  
SBS shared drive and gets  
and error that "not  
enough  
free space, disk full" when  
there is abundant capacity

Re: Not enough free space, disk full

on the HDD on  
the  
server?

Thanx.
