Have you taken any actions yet?
If not, try upgrade the videocard drivers.
Also change the monitor to see if the problems go away or remain.

Also, run BPA to see if it shows anything. if it does, fix it.

Hi

We have a windows 2003 server which is three years old and worked fine for. We have SP2 on but not SP3 as when we installed SP3 the Vista machines couldn't connect to the sbs network

Anyway, about 6 months ago the front screen (boot up and login)

Re: black screen

went black. The only colours visible are the Microsoft SBS logo.

When you press control alt del a black login screen appears. By clicking around you can find the login name box, and tab to the passwords and tab to enter.

If you get the wrong login details the error message box is black except for the exclamation triangle which is in colour.

Once you have logged in the screen is absolutely normal. This happens when you use the monitor attached to the server or remote desk top.

To be honest it is a pain.

I wondered if anyone had any ideas as i have none

thanks

jc
