I have been struggling w/ this one and have found no answers on the Internet.

Server 2003 (home office) Windows 2000 server (remote office). Not exactly sure when this problem started whether it begin before two (2) Vista machines were added to the network. Mixed environment of XP, W2K, and Vista pcs. I already had all pcs mapped to either server w/ no error messages....could map drives all day long between both offices. Now I can't create any new mapped drives from either office.

I'm not sure if Vista is the problem because of this. User is getting a new pc. Has old XP machine being upgraded and still using XP. Drives are mapped and you can map a drive to the remote office just fine prior to replacement. Replace pc and try to map a drive to the remote office.....when browsing for a folder the remote office server will either not show up or does show up but you cannot "open" it to access any folders or you finally get an error message as follows.....

Remote server is not accessible. You might not have permission to use the network resource. Contact the administrator of this server to find out if you have access permission.

I went to an older pc here in the home office while I was typing this and the pc will show the remote office server and let me map a drive to it. I have a new pc sitting beside me that will not see the remote server. I was talking to a user in the remote office and I was going to help them map a drive. They already had a mapped drive to the home server. Now they cannot see the home server nor map a drive and then gets the error message. It can't be a permission problem because they already have a drive mapped to the home server and can access it all they want....

Any clues?

TIA!!
