Yes it's set to 1, the antivirus software wasn't installed when Sp2 failed. (wasn't 'live' yet. / Using trend CSM)  
Yes the regular administrator account.

I used cacls to check and set the permissions, but it still refuses to let me even view c:\documents and settings\all users.

And I can't even understand why there is a c:\users\all users, or copies of administrator/default user they all seem ok except of course "all users".

That article is for "users shared folders" which isn't where I am having issues.

Check this registry key:

HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\SmallBusinessServer

Then look at the ServicePackNumber key. Is it set to "1"? If not, SBS 2003 SP1 may not have installed correctly.

Also, have you tried turning off your antivirus software (or other 3rd party software) on the server and then running Windows 2003 SP2?

Are you installing Windows 2003 SP2 using the Domain Administrator account?

Check permissions on the All Users folder...

Administrators: Full  
Everyone: Read & Execute, List, Read  
System: Full  
Users: Read & Execute, List, Read

Check Permissions on Users folder...

Default permissions for User Folders in Small Business Server 2003

After installing and running it, updating the problems it highlighted, it had 2 issues.

#1 POP mail connector (I didn't bother with this as it won't ever be used)

#2 SP2 for windows 2003 which fails to install.

The crazy magic folders of nonremoval remain intact.

Hi Aart,

Trying installing and running the SBS 2003 BPA to see if it can find any problems (make sure you have the latest update installed)...

Hi I have the oddest problem I have ever seen, the c:\documents and settings\all users is untouchable, as is c:\users\all users

I have not changed permissions intentionally

Re: SBS folder problem

or at all.

When logged in as administrator I can't browse / move or rename the folder, also a new all users.windows folder is created. If I right click properties the folder there is no security tab.

I have run xcacls / cacls to try and veiw / change permissions on this folder, it changes but still i Can't browse it.

When I try to run windows 2003 Sp2 it fails to install as it wants to write a bunch of .bmp files to the all users\application data folder.

What should I do ?

Thanks  
Aart
