Great, that's exactly what i want to do, where do I do that? I'm guessing I could do it in user account somewhere, look for email options, and check for a forwarding?

I'm a bit stuck and not sure where to do this, i dont want to miss a wizard, or set something that should have been set elsewhere. Where is the best place to do this and how?

Thanks again.

First let me explain why he cannot see internal mail on his yahoo account. These are two different email addresses. I'm "assuming" when you say

"after setting him up on the SBS2003 server, any emails sent using his Outlook user email (on SBS Exchange) are not getting forwarded to the Yahoo email address"

you set him up with an account and email address such as user@xxxxxxxxxx? If that is the case then how is exchange supposed to know about his yahoo address? You can set up his exchange to forward all emails addressed to user@xxxxxxxxxx to user@xxxxxxxxxx

Yes, the others will be added as I get any issues resolved. But his is the main email address, he is the main point of contact in the business.

One email account?

Dear All,

My client has his email and website hosted. Any emails he receives are forwarded to his yahoo email account. He uses the yahoo webmail account all day long. The problem I have is that after setting him up on the SBS2003 server, any emails sent using his Outlook user email (on SBS Exchange) are not getting forwarded to the Yahoo email address. So, if he checks his email on yahoo he cannot see any sent internal email, only emails that are sent externally.

I am guessing that Exchange is seeing the email is addressed to its email domain and then thinking "I don't need to send this anywhere, it's already arrived to me, I will just put it into the user's email box." How do I "fix" this so that a copy is forwarded onto his Yahoo email address too?

Other info:

Currently I do not have a MX record setup at the hosting company, is this related?

Other question, related:

I understand that I can setup an MX record like the two the hosting company currently use, except use a lower number for the priority so that this SBS Exchange server tries to collect the email first. Will this still mean that the hosting company will forward his email to his yahoo account, or will I need to forward any emails to the yahoo account?

Re: How do I get an email posted from a pc on the SBS server to send its email to exchange and outside to a yahoo address

I'm new to a lot of this, but keen to learn it.

By the way, this group has been an excellent source of info, in fact it's the best source I've used.
Regards.
