Hi all,

I have an SBS 2003 Server (SP2 + R2), and recently added a 2nd Windows 2003 R2 Server to the domain as an Application Server. When logged on as any SBS Domain user (even as the Domain Administrator) on the application server, I can run/execute any program on the local disks, but when I try to run or install a program across the network I get the following error:

"Windows cannot access the specified device path or file. You may not have appropriate permissions to access the item."

However, if I log on to the application server with the local administrator account, I can run programs across the network. Domain users on the XP Pro workstations can also run programs from across the network.

So it appears as if there is a policy being enforced by the SBS server which disallows logged on domain users on additional servers from running executables across the network.

Help. Can anyone shed light on this?

Thanks.

If I log on as any SBS user (even with Domain Admin rights) I can not run

Re: Domain Admin on 2nd Server can't run programs across the network

Re: Domain Admin on 2nd Server can't run programs across the network

programs across the network.

It appears as if SBS
