Hi, I tried both ways, using the Wizard and Manually – same result.

Hi all,

I have an SBS 2003 Server (SP2 + R2), and recently added a 2nd Windows 2003 R2 Server to the domain as an Application Server. When logged on as any SBS Domain user (even as the Domain Administrator) on the application server, I can run/execute any program on the local disks, but when I try to run or install a program across the network I get the following error:

"Windows cannot access the specified device path or file. You may not have appropriate permissions to access the item."

However, if I log on to the application server with the local administrator account, I can run programs across the network. Domain users on the XP Pro workstations can also run programs from across the network.

So it appears as if there is a policy being enforced by the SBS server which disallows logged on domain users on additional servers from running executables across the network.

Re: Domain Admin on 2nd Server can't run programs across the netwo

Help. Can anyone shed light on this?

Thanks.

If I log on as any SBS user (even with Domain Admin rights) I can not run programs across the network.

It appears as if SBS
