Hi

I have a Small business server 2003 running sharepoint. Yesterday I had to reinstall my server and now I have trouble to restore my companyweb site. I used the stsadm.exe -o restore -url <http://companyweb> -filename g:\backup.dat -overwrite command.

Now when I try to surf into the website I get this error in plain text:
"The Web site that is referenced here is not in the configuration database"

When I try to create a new website in the companyweb root i get this error:
"Error: A site with the specified name already exists."

When I try to delete this website(companyweb root) I get the following answer:
"Error:Cannot complete this action. Please try again."

And when I try to restore it ones more I get this text:
"No content databases are available for restoring this site collection.

Create a new content database and then try the restore operation again. To create a new content database, on the Virtual Server Settings page for the virtual server, click Manage content databases. On the Manage Content Databases page, click Add a content database."

I can create a new site with a new name, but as soon as I try to restore this website I get the same error.

Thankful for help, I really need this site! We have build a booking system for our resturant.
