- 

Over the past while I have been migrating XP computers to SBS 2003R2 using the ConnectCopter wizard without much trouble. On the last computer however, after the first re-boot, the migration stopped. I was left logged on to the \_SBS\_NetSetup\_ userid. I was able to back out and put this computer back on the workgroup, but now I'm trying to figure out why the migration failed.

In the SBSNetSetup.log (see below) I found this

CWizard::PrepAutoLogon() – couldn't open runonce key

I suspect this is why the migration did not resume after the reboot. What would cause this error?

Any help would be appreciated.....thanks.....brian
