Henrik (Hear) wrote:

Les, does this apply on a Windows2003 (non-SBS) AD domain network as well?

Domain Controllors and members have a well defined time sync algorithm and you do not want to break it.

PDCe's should be the only servers getting external time sync. All others should maintain the time sync heirarchy.

<http://technet2.microsoft.com/windowsserver/en/library/71e76587-28f4-4272-a3d7-7f44ca50c0181033.mspx>

That said, what Les posted works excatly the same for other PDCe's (Like SBS is) as well.

Regards

Copy and paste these lines into notepad, and save as
<yourname>.bat

Watch for line wrap, there are 5 lines, the first ends with the word
MANUAL.

Re: SBS 2003 Time sync problem

```
w32tm /config /manualpeerlist:"0.pool.ntp.org 1.pool.ntp.org  
2.pool.ntp.org",0x8 /syncfromflags:MANUAL
```

```
w32tm /config /update
```

```
net stop w32time
```

```
net start w32time
```

```
w32tm /resync /nowait
```

Run the batch file on your SBS. You can replace the time server list (between the " and the ") if you like, but you probably don't need to. Check your event log for successful time sync after you run it.

Is there a way to change the location or server to which SBS 2003 syncs its time.
