This is probably a ridiculous question, but I'll ask it anyway what is the "best" way to create a plain User account to run the server on a daily basis?

I had tried to create a User in Server Managment and give it logon rightrs just to the server, but I wasn't able to login. I remember seeing some details in the Event logs, but they escape me now), so was thinking that I should use Control Panel >> Users, and create a local user there.

But then I stopped and thought I'd better ask first before trying something I "think" will work.

As always, thanks in advance,
Mike
