Hi Allen

Yes we need two sepearte RAID1 arrays. How do I put the two new disk on the second channel? If I insert them in the front slots of dell server they end up in channel1. Do I need to open up server and install disks there for channel 2?

Thanks

Regards

Are you wanting 2-RAID1 arrays? If yes then yes you do need to have them on seperate channels.

Hi

Yes the drives are there in RAID configuration utility that is where we made RAID1 out of the two new disks. We have a dual channel raid controller but the two new disks that we have added on the front of dell server also end up on channel 1 in RAID configuration utility like the previous two disks. Do these need to be on seperate channels?

Thanks

Have you booted into the RAID configuration utility and make sure you can see the drives there? Are you using the DELL Disk Array Manager Console? What do you see? Do you have a Dual Channel RAID Controller?

Hi

Our Dell Perc 4/Di had two disks in a RAID 1 configuration. Now we have added two more disks and have made another RAID1 out of these two. In Perc configuration old and new raid sets appear as two logical drives. However when I reboot the server it says 0 logical disks found. The only way for me is to take out the two new disks and reboot and then the original logical disk appears and I can boot into windows. What am I doing wrong and what is the correct way to add another pair of disks in a RAID1 while there is another pair already in RAID1 on Perc 4 /Di?

Many Thanks
