could be binding order of the NICs, and 'comment' would be that a 'standard workstation' would be a better example than one with VMWare installed (the VMWare Virtual NICs will be impacting the problem).

Hi there,
My SBS 2003 Premium installation has a bad habit – over a period of about 12–14 days (it varies) the intranet works fine. I set the home page for all users to the intranet so it is the first thing that users see when they start their browsers. Then, out of the blue, I get:

Internet Explorer cannot display the webpage
Most likely causes:
You are not connected to the Internet.
The website is encountering problems.
There might be a typing error in the address

This is a regular occurrence. My tech support cannot put their finger on the problem. I have tried restarting all related services (IIS, DNS, etc.) The only resolution seems to be to reboot the server – which is a pain in the arse.

I was wondering if anyone else has encountered this or has any comments.
Cheers,
Kim.
