I logged onto my SBS machine as a domain admin and installed WSUS 3.0. Everything works, but there's just this one problem – WSUS services, and the way it accesses my SQL Server instance are done using my domain admin credentials. I would like to restrict WSUS so that it uses less privileged credentials.

Can I install WSUS 3.0 by logging onto my SBS machine as a local admin?

And why couldn't Microsoft let us specify a less privileged domain user account while installing WSUS 3.0? I guess we should feel privileged at this time that we can at least specify the SQL Server instance it goes against.

Thanks.
