Actually IDK for sure whether it is Standard w/ISA or Premium. It has been over a month since I worked on this and now (with good reason) they are wondering what my next steps are.

Since I have never installed ISA how will I find out how this all was configured?

"SuperGumby [SBS MVP]" wrote:

'messed up DNS and ISP', in what way?

and just to be sure: You state SBS Standard, and ISA. ISA Standard (2000/2004) can be installed on SBS Standard but you don't get (AFAIK) SBS integration, or is ISA on a 2nd box? Either way, manual implementation of proper rules in ISA will allow this to work. Funnily, I think ISA 2006 is OK standalone but more problematic on SBS.

Version of ISA? and do you in fact mean it was SBS Standard upgraded to Premium?

I have a customer who has a single server SBS 2003 Standard on a network with 11 users. The server was configured prior to me being there admin and the person installed ISA. Now most of my client base consists of under 20 users in a single server environment and I have never used ISA in any of the installs. Anyway, the organization has no method of using OWA or RWW and the old admin is telling me it is because they have ISA installed and I disagree. I think it is configured incorrectly and or the issue lies within

Re: ISA and RWW

their messed up DNS and ISP. In regards to hardware they only use an ISP issued modem/router.

Any thoughts?
