That clears it up! From what you had said, I thought Kerio was on the same network, which would have been an easy fix to just change its ports. But now I understand it is just another web server on the network with SBS.

Yes, your questions have been answered. Actually, that raises one more. If it is just a web server, why not change its HTTPS port instead of changing the highly-integrated SBS server?

Or better yet, get a separate IP address and a corporate-grade router to handle the multiple IP addresses and forwarding.

Sorry for the confusion but someone did a port scan on me and found I am running Kerio which is correct. This question is not related to the port scan it is for a different network. The network I am talking about already has a HTTPS running on another web server that we need access to from the outside. The SBS server we would like to have RWW work without using HTTPS but it seems this is not possible and or I need another link to access it. I guess my question has been answered.

Thanks

Ross,

You seem to be contradicting your answer to Cris Hanna when he and others were asking your intent. You stated, "I can not use https. Https goes to a different server running webmail. Maybe I am confused or wrong but you cant have two servers behind a firewall running https and allow outside connections in." That sounds as though you have a webmail server and an

Re: RWW with no https

SBS

server on the ****same**** network. Later, you stated, "Basically that server (webmail) is running Https, I still have http open and free to use where ever. I would like to use it for RWW, is this possible?" That statement also makes it sound as though the two servers are on the same network, but now you say they are totally different.

Can you explain what "Basically that server (webmail) is running Https, I still have http open and free to use where ever. I would like to use it for RWW, is this possible?" really means?

Does the network on which SBS resides have another server or not? If it does have another server on the same network, what is it doing that precludes you from using the standard ports?

If it is a totally different network, and the webmail server is NOT on the same network as SBS, then what is the problem with leaving SBS at its defaults?

Gregg – This is a totally different network.

I got the Kerio reference from your domain name, gruskingroup.com, in your email address. You stated, "Yes I use Kerio for the 75GB limitation Exchange has but I don't want to get into a debate about that. Basically that server (webmail) is running Https, I still have http open and free to use where ever. I would like to use it for RWW, is this possible?" It sounded as though it is Kerio and is on the same network as SBS.

So are you now saying that the webmail server and the SBS are NOT on the same network?

Re: RWW with no https

Or are they both on the same network, but it is not Kerio?

Ross,

You did not reply to my question regarding changing Kerio's ports instead of SBS's ports. From our 10,000' view (not knowing your details), it looks as though this procedure would be easier to do on Kerio than trying to hack SBS.

Is there a reason you cannot use Kerio's method to change its ports?

A report from dnsstuff.com indicates that
you have Kerio Mail
Server.
Would
it not be easier to change Kerio's ports
(<http://support.kerio.com/index.php? m=knowledgebase& a=viewarticle&kb...>)
than to hack SBS?

I can not use https. Hhttps goes to a different
server running
webmail. Maybe I am confused or wrong but
you cant have to servers
behind a firewall running https and allow
outside connections in. I
know if its over http and at port 8080 that
will work, or at least I
think I am correct. I am not running SBS

Re: RWW with no https

2008, I have 2003. Yes 4125
is now changed to 8080 in the registry but I
am not following you on
the proxy part.
Thanks

What is the issue around
connecting to the RWW site
via SSL?
You're
users
don't like the popup security
warning? Or they don't want
to take
the
time
to install the certificate on
they're local machine to
make those
warnings
go away.

SBS 2008 absolutely
requires connection by SSL
and you won't be
able
to
get to the desktops without
the certificate on the remote
box

I basically want to run
Remote web workplace over
the standard web
port but going to port 8080.
I have what I thought
changed the
registry setting for RWW
from 4125 to 8080 but I
want to run the
site
by http and not https. Is this
possible?
