also, when you mention 'Netbios issue which is enable on both network cards' do you mean that each SBS has two NICs, or that each has a single NIC with NETBIOS enabled?

Hello

I have a customer who has two SBS domains linked via a IPSEC VPN tunnel. This is working correctly and all machines are visible via name resolution and ipaddress search. However, my customer would like to be able to see both domains (and computers there in) from My network places.

At present, on both machines the two domains are both listed but I am unable to drill down into the other domain, I.e. from SBS box on Domain A, I can see Domain A client computers, but can only see Domain B listed, not the client computers on that domain.

It would appear to be a Netbios issue which is enable on both network cards. Likewise within the WINS server on each machine the two machines have been set up replication partners and both appear to be working as machines are being listed.

I am at my wits end, any help you could shed I would be most grateful.
Kind regards
Lewis
