Make sure your BIOS is trying to boot off the correct drive. Sometimes this gets reset.

Operating System Not Found – I get this message when booting up my SBS 2003 server. How can i fix this?
I am running a hardware based raid solution and the RAID is healthy. I have tried using recovery console bootcfg, fixboot and fixmbr, but the problem still persists. I have also tried to do a Repair installation using the SBS 2003 DVD. After it copies the installation files locally and restarts, I get the same message. The BIOS can detect the RAID Disk and is set to boot from it.

I also tried using diskpart to see if the correct partition is marked active. However, it doesn't give any information on which partitions are active or not and it doesn't give me an option to make a partition active.

This is leaving me scratching my head.

Any ideas or suggestions would be great!
