Hi Everyone,

created a login script under the "Default domain policy" OU, runs fine on the servers, but how do you get it to execute on w98 systems, the following is the location where its stored.

```
\\myserver.local\sysvol\myserver.local\Policies\{000000-00000-000-0000-00000  
0000000}\User\Scripts\Logon
```

the W2kpro and Xp systems work with this, but Win98 just bypasses everything.

i don't want to specify on each use the "logon path". most of the systems are upgraded, but i'd prefer to use the new features of W3k if possible in GPO, instead on "netlogon.bat" for everyone.

thanks in advance

Peter
