Thanks everyone for your replies. The admin rights on the laptops were the only thing I could foresee as the main issue. I was hoping a dream script would be able to at least check against the domain or MAC of the machine and tell the dhcp server to not assign an ip no matter what. I know there is so much more to this than my knowledge of scripts goes. I would love to see what's going on with our IDS but policy won't permit me to. Lord only knows what the person running it is doing. I barely see them in the office. Anyway I will keep looking for a fix. Tends to make me miss the static days. Heck! Even if I could get a script that would notify me of such an event, at least that way I can instantly contact the remote site and inform the local IMO to go and remove the machine. At the current time I'm catching them roughly 3 or 4 hours after there on (some days it's worse cause I just don't have the time. I just spent the last two weeks re-imaging 200 boxes that need to be deployed state wide by end of June. Would be nice to have a hardware department.) Once I discover them I'm taking a quick band aid fix and tracing them down to the port and then shutting it off. Bad thing is they just move to another part of the building and plug back in. Such a pain in the A** and surely not a safe way to do business. I agree the nightmares are only going to get worse. There are days I wish such bad things will happen in order to make the pencil pushers and number crunchers take notice. All they can think about is the bottom line. When my boss explains to them how much they can lose if they don't create a company wide policy and enforce it, they just don't think it will happen. Funny thing, I have this feeling when something does happen I will be the 1st to get the axe. Once again thanks for all your help and input guys. Bing
