Hi Omar;

The profile is a way for users to customize their shell environment. The side-effects are important, not the files themselves. After all, what's stopping somebody from having an empty profile at the location you require?

What is driving this goal?

If a certain side effect is important, then you should verify that instead.

Conversation: Location of the profile.msh for custom provider
Subject: Location of the profile.msh for custom provider

Hi all,

I am developing a provider in Monad (MSH) and I found that the default profile file must be located either in the users dir or in the all users documents dir. Is there a way to say the Provider to use a profile located in the same directory where it is running? It is because I want that all users must have the profile.msh. How can I do that?

Thanks in advance.

Omar Vera
