Is there a way to programmatically get Disk Mirror status from the Logical Disk Manager?

I have noticed that in WMI class Win32_LogicalDisk most of the information are not populated.

We have used DMDIAG utility from Windows Support Tools but we can only get the failure information when the faulty disk was removed from the system.

The goal is to get the information about error status such as:

- Rebuilding
- At risk
- Failed redundancy

It will be good having a direction that involves either VBScript, WMI, COM, DLL, anything

Any suggestion will be greatly appreciated

Thanks
