For our security management task we use Security Explorer from Scriptlogic (<http://www.scriptlogic.com/sxp>). Permission extract is one of its features we use frequently to build permission security skeleton for the domain or specified part of its members. We usually extract permissions remotely to CSV file or to MDB when there is lots of objects when say user changes his workplace. The handy thing is the ability to export permission only when there's difference from parent. This allows revealing inheritance blocking.

GMan wrote:

Hey All, previous sys admin had issues with assigning folder permissions to groups. His solution was to put user names in the folder security tabs. We want to correct this with groups. Initial investigation shows that usernames are embedded in multiple folders throughout the entire share. Instead of going to each folder to find who's there, is there a way or script to take a given username and return a listing of all the folders where this user has been added to the folder permissions tab?

Thx GMan
