You might get ideas from the Microsoft Script Center section on scripting ADAM:

<http://www.microsoft.com/technet/scriptcenter/scripts/ds/adam/default.aspx>

There are scripts that enumerate all attributes of ADAM objects (and their values). For example:

<http://www.microsoft.com/technet/scriptcenter/scripts/ds/adam/list/amlsvb07.aspx>

No the loop is to modify attributes in ADAM. The attribute keystring modifies different "KEYS" in ADAM

How do i change this script to use a loop

On Error Resume Next

Set objUser = GetObject _

("LDAP://localhost:51008/KEY=xxx.key=Services.key=Configuration.key=yyy.key=zzz.CN=
objUser.Put "KeyValueString", "bbb"
objUser.SetInfo

Re: for loop on this

Set objUser = GetObject

("LDAP://localhost:51008/key=qqq,key=Services,key=Configuration,key=yyy,key=zzz,CN=a

objUser.Put "KeyValueString", "bbb"

objUser.SetInfo

You need to tell us what your loop condition is. Do you want to run it twice? Until a certain condition is met? Until an error is encountered? Other?
