Hi,

In the IIS Manager, expand the computer's name, and the "Web Sites" folder, then right-click the website which you would like to allow .rss files to be served on, and select "Properties". Alternatively, you can right click on the "Web Sites" folder and select "Properties" to apply these settings to all of the websites hosted on the computer, instead of applying the settings website by website.

In the Properties screen, click on the "HTTP Headers" tab. On the bottom of this property page, click the "MIME Types." button. A list of the custom MIME types set on this computer will now be displayed. On the right side of the MIME type window click the "New." button. Since you want to allow .rss sites to be served, type the extension ".rss" (without the quotes) into the first text box. In the "MIME type" text box, type "text/html" (without the quotes) and press the "OK" button on both of the dialogs, and "Apply" on the Properties window.

.RSS may not be text/html so you may want to check under HKEY_CLASSES_ROOT for .rss to find its MIME Type
