I was able to get the network to work by putting in the drivers cd & asking to upgrade driver in device manager. It works thanks. (i don't know if it's using the xp or w2k driver, i don't really care just so it works).

Now, I'm trying to enable RAID...w/ 2 SATA drives. simply installing on one then adding the 2nd and enabling a raid didn't work (the disks got wiped). Manual says you must install Application Accelerator to ADD a 2nd disk to an already built system (but the driver disk wont let me add application accelerator).

Guess I'll try downloading it and burning it to CD then try installation that way.

Any ideas?
