Hi..

I've been setting up & tweaking this server for the last few days and today was doing some final group policy tweaks (using GPMC & yes I patched it with KB842933) – I was prompted to restart after some automatic updates happened, and since then I've been unable to get into the GPMC. Every time I try it says:

Microsoft Visual C++ Runtime Library
Program: C:\windows\system32\mmc.exe

This application has requested the runtime to terminate it in an unusual way. Please contact the applications support team for more information.

I then click OK, and get :

mmc.exe – application error

The exception unknown software exception (0x40000015) occurred in the application at location blahblah, ok to terminate cancel to debug.

I click OK and get

The application at 0x00000000 referenced memory at 0x00000000. The memory could not be "written".

Help!

.
