Hi:

If you want to get rid of SP2 and if you can not boot in normal or safe mode, boot your windows 2003, go to the recovery console cd and execute:

```
cd %windir%\$ntservicepackuninstall$\spuninst
```

```
batch spuninst.txt
```

Let us know how it goes...

Hi!!

When I install the SP2 on my Small Business Server 2003, the installation process give me an error and undo the installation. Then I restart the server and after the logo of Windows 2003, when is switching to next screen (windows screen with the message 'applying computer' setting and log in) the system give me a blue screen without any message (only with the typical message that may be it's a hardware problem bla bla bla).

If I try to open Safe Mode or Last Known Good Configuration I have the same problem. It's possible to use the System Restore Point if I cannot access to a command prompt?

What can I do, please?

I would appreciate your comments very very much.

Thanks,
Pop
