Hello Pop,

Please post an ipconfig /all from the dns server and the new one. If you do not use both NIC's with teaming disable the not used.NIC.

Best regards

Meinolf Weber

We have a Windows 2003 Standard R2 SP2 server just added to the network. I have DNS, DHCP and AD running correct as far as I can tell. All of this is running on a Dell PowerEdge 2800. I had help setting up DNS and DHCP so I know those should be good. Though since the server has 2 NIC cards, it is all pointing to one of the cards. When plugging in the network cable to that card. Nothing happens – no internet, no network, no nothing. When plugging the cable into the second card it pulls the IP address from the NT4 DHCP service on the network, but looks at 127.0.0.1 for DNS.

I am not sure where I went wrong, networking is a new skill set.
