Hello all, we have a 2003 terminal server running in terminal server mode currently hosting 2 applications. We installed office2K using the TermSrvr.mst (ORKTools) file via the command prompt as specified in MSKB224313. Regular users are restricted from doing much other than running the necessary applications via Group Policy.

Now upon running a test for regular users we are receiving the error...

"Only administrators have permission to add, remove, or configure server software during a Terminal services remote session. If you want to install or configure software on the server, contact your administrator."

To successfully install Office I had to first edit the registry key  
HKEY\_LOCAL\_MACHINE\software\policies\microsoft\windows\installer, DisableMSI=0. This had been set to DisableMSI=2 (disabled), but as mentioned this is no longer the case.

Can someone offer assistance?

Thanks,  
Andy
