hi all,

>I have two LANs which connected as a WAN through VPN connection. There is a firewall at each site, and it set to forward the Terminal service to a specified IP address on the site which is a terminal service server. The ip address range of the first LAN is 192.168.10.0-255 Terminal service server address is 192.168.10.2 public ip example : 202.100.100.89

The ip address range of the second LAN is 192.168.11.0-255 Terminal service server address is 192.168.11.2 public ip example : 203.49.56.90

I can terminal service to the server on the other LAN using it LAN ip address. i.e from LAN 192.168.10.x to 192.168.11.2 However, when i try to use the public gateway, it fails. i.e if i try to terminal service from 192.168.10.x to 203.49.56.90. Since the service is forwarded, i imagine it should be alright. However, i don't have any terminal service license running on the terminal server, but i just use it for the administration purpose.

Firewall setting:

this is put on the very top of the list and there is no deny statement before it.

Allow access terminal service from * to 192.168.11.2 >

Any ideas?

Thanks in advance

Ken
