Hi all,

We have a W2K terminal server serving a remote office through an internet connection. Our clients want to access their local drives while they are in a terminal server session. The article KB272519 clearly says it is not possible in W2K when using internet. But the article KB313292 says you can use a new feature called "Remote Desktop Connection" when connecting to 2003 server and XP and access local drives when connecting through the internet. But which is the relationship between "Remote Desktop Connection" (RDC) and the terminal server? Does the RDC block the 2003 server computer from another user as other remote access programs do? Can I have various terminal server sessions using simultaneously RDC? And how about XP? Can I have many simultaneous RDC sessions in a XP Professional box? My suspicion is why local drive access is not a Terminal Services feature instead of Remote Desktop Connection feature...

Thanks in advance

Faustino
