I believe that would do it. Can one access the site from a remote client at a cafe per say, do you always need to load the client files. What username and password does it use, I dont see a location for user name and password? i have tried to add the web component within Windows 2000 but it does not list this: In the Add/Remove Programs item in Control Panel, under Add/Remove Windows Components, install Microsoft Internet Information Services (IIS). Install the World Wide Web Service subcomponent of IIS. Install the Remote Desktop Web Connection subcomponent of World Wide Web Service.
Is this only for Windows 2003?
