MS support told me the delay in userinit terminating is caused by 2003 SP1, which added a setting to autoenroll certificates. My trouble is that the policy setting they told us to change in order to stop the autoenroll is missing.

He said change User Config/Windows Settings/Security Settings/Public Key Policies/ then Roaming Settings (or something similar)—but there is nothing below Public Key Policies except Enterprise Trust (which is empty). He said the policy is missing b/c something went wrong with the SP1 install and we should uninstall/reinstall—(which we don't want to do) and then change the (then visilbe) setting to Do Not Enroll Certificates.

At this point the 60 second wait is no big deal since most users will be logged in that long—but what I'm worried about is that this missing policy setting is a sign of a botched SP1 install and we will find other TS settings missing in the furture. This is a server we just brought on line yesterday and we would rather start over from scratch that reinstall SP1.

Is there a way to see this policy setting without doing the reinstall?

Thanks,
-Rich
