Ok guys i have read through the group and got lost of info on not puting TS directly on the web. I want to explain my setup and get some solutions. (if any). thanks for reading...

I have a setup of 2 servers and about 5 users. one server is an DC w/AD and Exchange the other is TS app server. Internally it's not an issue, users connect and work off the TS box. I also need to get some remote users on the TS box. This is easy enough, i have a vpn firewall and client software to initiate a VPN prior to TS startup.

The problem i have is one user goes on site to his client locations to drawup legal documents. If he forgets something or needs to get some data from his TS account he could just take his laptop and login via VPN/TS. The problem is he cannot print the documents! If he could use the clients computer with net access and go to TSweb then he could map the local printers and everything is fine. To do this it would mean either opening the TS to the web OR installing client software on someone elses computer. Obviously this is not acceptable. Is there a way to do TS over https with an ssl cert or something to make it more secure? Could i do this to the firewall or to the server? Are there any other suggestions? He doesnt like the idea of emailing the docs to his location to print and doesnt want a thumb drive. Right now he is on a outsourced IT program where TS is available throught the web. I assume they just secured this thought https.

Thanks for any thoughts you might have.

dm.
