Drew,

thanks for your answer.

ACL on the specified folder are set correctly. I am able to import the cert for the user on a PC (different profile). Only on the WTS ist won't work.

As local Admin or Domain Admin it works also on the WTS. The User with local Admin group membership will not work...

Any mor suggestions?

Sven

Hi,

Check out these KB articles to see if they describe exactly what you see.

<http://support.microsoft.com/?kbid=269518>

<http://support.microsoft.com/kb/313494>

Also, I ran into a user post suggesting to change some folder permissions:

> I change perms on C:\Documents and Settings\All

Users\ApplicationData\Microsoft\Crypto\RSA\MachineKeys folder to allow full control for administrators and then the certs imported correctly.

(<http://pluralsight.com/blogs/aaron/archive/2004/07/13/1623.aspx> – near bottom of page)

Thanks,

Drew

All,

I have a small problem installing a certificate for a user on a Windows
2000
Server with WTS enabled.

When the user tries to install the certificate (.p12 file) he receives the
following error:

An internal error occurred. The private key that you are importing might
require a cryptographic service provider that is not installed on your
system.

When I am doing this as a local Admin it works fine.
Now my thought was to make the user a member of the local admin group on
the
server and install the certificate, the log off the user and remove him
from
this group.

The same error message occurs when trying to install the cert.

Anyone can help?
