You can configure a local policy, but it will probably be of limited value.

The order of application of GPO's is:

Local
Site
Domain
OU
Child OU

GPOs lower in the list have higher priority, i.e. their settings override any conflicting settings in the policies higher in the list. "Block Inheritance" and "No Override" can change this inheritance behaviour.

Moreover, you cannot filter a local policy with security groups.

You should really talk to the IT managers at headquarters and have them apply the policy settings that you want to your TS.

my SINGLE win2003 enterprise TS machine is part of the AD domain. However we are not given the permission to govern our OU gpo, etc In another words, our GPO is grey out.

I've read books and in this forum that GPO is the way to go for easy managability.

Since our headoffice does not allow us "freedom" to manage GPO, can changing local policy on my single TS helps ? ie the local gpedit.msc will do what in a domain GPO does ?
