The two rights you mention below were absent from the list of privileges returned by this command when I ran it on a DC. Any idea why?

On a DC, you need to remove the Administrators from the SeDenyRemoteInteractiveLogonRight user-right assignment and grant them the SeRemoteInteractiveLogonRight user-right.

The quickest way to check group membership and user-rights it to inspect the output of

```
c:\debuggers>cdb.exe -c ".logopen token.txt;!token -n;.logclose;q"  
notepad.exe
```

assuming you have the debugger package installed in c:\debuggers.

Hi,

I've read conflicting information as to whether or not the "Allow Log on Locally" user right is

Re: Which rights are required for TS to work on a DC that is running Server 2003?

required in order to use TS on a Domain Controller running Server 2003.

This posts suggest that it is required:

<http://groups-beta.google.com/group/microsoft.public.windows.terminal...>

This KB article also says its required (at least for Win2k):

<http://support.microsoft.com/kb/247989>

However, a snippet from this article suggests that if "Allow Log on through Terminal Services" is set, that it will suffice, even for a DC:

"Allow log on locally

This policy setting specifies which users can start interactive sessions on the domain controller. Users who do not have this right are still able to start a remote interactive session on the domain controller if they have been assigned the Allow logon through Terminal Services user right."

<http://www.microsoft.com/technet/security/prodtech/windowsserver2003/...>

Can someone please clarify, which of the two rights are required for TS to work on a DC?

Thanks,
