Added the users to Remote Desktop Users group still i get the error message stating,

Logon Message

To log on to this remote computer, you must be granted the Allow log on through TErminAl SErviceS right. By default, members of the REmote Desktop Users group have this right. If you are not a mmember of the REmote Desktop Users group or another group that has this right, or if the Remote Desktop User group does not have this right, you must be granted this right manually.
OK

How do i make a regular user login into terminal services ? In my case unless the user is added to Administrators Group, terminal server session is not accepting the user to login.

When add the same user to Administrator group, terminal server session is starting fine.

Q. My session doesn't logoff when I quit my starting or published application

A. If you define a Starting application, either in Terminal Services Configuration, a GPO or in your RDP client, your session should be automatically logged off when you quit the application. Sometimes, this doesn't happen and you are left with a session which only shows the desktop background, without the possibility to log off the session manually. The cause for this problem is a process which is still running in your session, preventing it from closing and logging off. The same can happen after quitting a Citrix published application.

Re: Terminal Services RDP-TCP Listener not found

To solve the problem, open a second connection to the Terminal Server and check in Task manager which process is keeping the session from closing. Some anti-virus applications are known to cause this behaviour.

If you can't avoid running the process, you can use a work-around to log off your session.

Create a batch file, containing something like this:
cd <path_to_the_folder_containing_your_application>
start /wait <application_executable>
logoff

Now define this batch file as the starting application.
Or use the following vb script to launch your application, and define the vb script as the starting application.

```
Dim objWshShell, objExec, strAppExe

strAppExe = "<path_to_the_folder_containing_your_application>
\<application_executable>"
Set objWshShell = CreateObject("WScript.Shell")
Set objExec = objWshShell.Exec(strAppExe)
Do While objExec.Status = 0
WScript.Sleep 500
Loop
Set objExec = objWshShell.Exec("logoff")
```

For a different solution to the problem, and a list of known processes which cause this behaviour, check:
