Vera

I think you're right. I've not done a good job of explaining it !
Under my "Term server" – not "PC" for c:\windows\system32 is :

Account Unknown : evrything except Full control
Administrators: full control
creator owner – nothing checked
system – full control
users – Read/Execute, List, Read

I have some remote users who can access everything ok, maybe a little too much though. I can screw this down little by little as I need. With this in mind I tried just copying one of these users to create my new user. They can't start delphi because of some access restrictions. The errors don;t really mean much – access violatons etc. and I don;t expect you to be familiar with it. The only folders delphi uses when starting are system32 and c:\program files\borland\delphi and maybe something in subfolders, and the registry of course.

I'm getting to the point of paying someone to access this and get it working, as I've got programmers twiddling their thumbs at the moment.

Thanks

Andy

Andy, I've got the feeling that we have a misunderstanding going on, because with the default NTFS permissions on the C: drive, and normal user rights, this should be impossible.

When I look at the security settings on my C:\Windows\system32 folder, it says:

Authenticated Users : Read + Execute

Re: deny access to all but 1 folder

Server Operators : Modify
Administrators, CREATOR OWNER, SYSTEM : Full Control

So no way can a normal user delete anything under system32.
How are your permissions on that folder?

And you say: "the user can delete anything they want in
system32 or any other folder on the PC"
Is "PC" a typo? Aren't we talking about a Windows 2003 Terminal
Server?

I understand what you mean about hiding etc. but in response to
:

Again: what is your problem with these users having the
default
NTFS permissions on c:\windows\system32\?

I tried this and the user can delete anything they want in
system32 or any other folder on the PC, they might as well have
admin rights.

It looks like the only option is to configure security on every
top level folder in drive C, which isn;t the end of the world.

Thanks
Andy
