As far as I can remember, the TS Licensing Manager in Administrative tools does **not** mean that you installed TS Licensing. The tool is always there, because you can use it to connect to a TS Licensing Service on a remote computer.

So you'll simply have to install the TS Licensing Service, in Add/Remove programs – Add Windows components.

New box was a fresh install. TS licensing server was already installed/running on it (or at least the icon was in admin tools). When I click on it, it opens but I am unable to do anything (connect to a server, activate, etc). I am thinking I might try to reinstall WTS on the old W2K box then reinstall TS Licencing on the nex box (SBS). Any other ideas? Thanks much for the help and the time.

"Vera Noest [MVP]" wrote:

How did you recreate the new box? Fresh install? If so, did you install the Terminal Services Licensing Server? Did that give any errors?

If you used backups to recreate your environment: is the TSLs service running? Any errors in the EventLog?

Pulling my hair out on this one, any help appreciated.

Replaced a SBS box with new hardware, recreated the domain environment successfully. Everything works great except WTS that is running on a W2K server on the same domain. WTS licencing server was installed on the old SBS box so I am trying to install it on the new hardware and hopefully get remote access back up. However....when I get into Terminal Server licencing app I dont see any servers I can add – I cant browse to or type in by name. Not sure how to proceed if I cant get the WTS licencing program to see any servers. Once I can connect to a server I have plenty of documentation on how to configure. ANY advice appreciated. Thank you
