It turned out I was checking the local tcp group but I didn't know I needed to add the user to the local desktop users as well. Why do I set this in AD if I still need to add them to the local computer. Is there a way to automate this when they are added to the remote desktop group?

If you don't know if your server is a Domain Controller, it probably (hopefully :-)) isn't.

You can check it by running Start – Administrative tools – Active Directory Users and Computers. Find your server's computer account, it's probably either in the OU "Domain Controllers" or in the OU "Computers". Right-click the computer account – Properties. On the General tab, there's a box named "Role". This lists it either as a "Domain Controller", or a "Workstation or Server."

To check membership of the local Remote Desktop User group:  
Start – Administrative tools – Computer Management – Local users and Groups – Groups – Remote Desktop Users.

I thought yes to both but how can I confirm?  
Thanks

Are all servers member servers in a domain?  
Are the users members of the local built-in Remote Desktop

Re: Users can only login to one TS server

Users group on each server?
