Make sure that offline caching is turned off on the profile share.
If that doesn't solve it, enable verbose logging of the user environment to see exactly where the system is trying to locate the profile.

I'd appreciate any thoughts on the following issue...

I have a farm of 5 Windows 2003 SP1 Citrix servers, to which users are connecting via Windows XP.

On one of my servers I've created a new share called \\Servername \TSPfiles\$ and configure the permissions appropriately.

Then for testing I used the terminal services profile tab on my AD user account in order to point to the folder. \\Servername\TSPfiles\$ \%username%. Unfortunately when logging on to Citrix or when using RDP itself, it won't create a roaming profile. I've used this exact process within a single server VirtualPC instance and it worked fine, however there are vast differences in the group policies applied. Including loopback processing in the real environment.

As an alternative I've tried using group policy to apply the path \\Servername\TSPfiles\$ and experienced exactly the same

Re: Terminal Services Roaming Profiles

result...

"Event ID: 1523. Your roaming profile (read only) is not available. You are logged on with the locally stored profile. This may be caused by incorrect file system permissions or network problems. Contact your network administrator. DETAIL – The system cannot find the file specified."

What is confusing is that it works with my testing in a simple environment. Does anyone have any good trouble shooting suggestions? Note that I've confirmed "ProtectionMode" is set to 1 in the registry.

Thanks in advance
