A bit more background. Our LS is in forest A and we do not want to move it to a workgroup. Both domains and TS servers are Server 2003 SP1. I am basing my decisions on <http://support.microsoft.com/?kbid=279561>. I'm still looking for suggestions for the minimum Trust required.

"Vera Noest [MVP]" wrote:

Aaah, now I understand what you mean.

I never thought about the client devices, since they never have any direct contact with the TS Licensing Server at all. I was only thinking about the Terminal Server and the TS Licensing Server, because the only communication is between these two server roles (in Windows 2003).

And now of course it makes sense to differentiate between 2003 and 2008, since in 2008 there must also be communication between the LS and a DC (in User licensing mode).

Guess I'd better update my FAQ :=)

Thanks, Ratnesh!

Sorry about the typos :(

Well actually i wrote it from the point on view of the client.

Meaning

Per Device: Client is the machine from which user are connecting. And

that machine is not required to be any trust relationship with

Re: Trust requirements for TS License Server in a different domain

License Server Domain

Per User: Client will be User ID. In that case Domain of that client

have to be in trust relationship with License Server Domain

Sorry I should have mention that. Thanx Vera for pointing that out.

Ratnesh, I don't think that I agree with what you say, but I might misunderstand what you mean, since there are obvious typo's in your post. You seem to differentiate between Windows 2003 and Windows 2008, but you've called them both 2008. You are also mixing up Per User and Per Device TS CALs. Per User TS CALs are actually never issued in Windows 2003, so there you have less requirements. Per Device TS CALs *are* issued and demand a proper trust relationship. You state that this is just the other way around.

other domain.
Thing needs to be taken care
(from point of
view of License Server only)
– License Server machine
should be
member of TSLs (Terminal Server license
Server) group on each
Domain Controller in the trust.
– Per Device: It will work even with out
trust.
Only thing you
need to worry is discoverabilty of Licesne
Server

Windows Server 2008 Terminal Servers
– Per User Mode: Tracking is not supported,
hence
no need to any
trust just for License Server
– Per Device: It will work even with out
trust.
Only thing you
need to worry is discoverabilty of Licesne
Server

Above things are from prospetive of License
Server only

I've located most of the
setup information to have
terminal
servers in domain
forest B to acquire their TS
device CALs from a License
Server in domain forest A
(via registry settings, a
hotfix,
and forest trust). My
question is
what is the minimum forest
trust required to enable this?
I

Re: Trust requirements for TS License Server in a different domain

would rather not
have the domain B's 'name'
appear as an option on the
logon
screen on Domain
A's PCs.

one-way, incoming, forest
trust for one side of the trust
one-way, incoming, forest
trust for both sides of the
trust
one-way, outgoing, forest
trust for one side of the trust
one-way, outgoing, forest
trust for both sides of the
trust
two-way, forest trust for
one side of the trust
two-way, forest trust for
both sides of the trust
